## WaterGUIDE.online – Nutrient loss mitigation Manual and training material

Read the text in the box below before you use the system

This decision support tool was developed by the Swedish University of Agricultural Sciences (SLU) within work packages 3 and 4 in the Interreg Baltic Sea Region Programme project Waterdrive in collaboration with a number of project partners.

**Please note: The decision support tool is provided as is, the information presented is not guaranteed to be error free, and in most cases it was generated in a more general scale than the field level. The authors do not take any responsibility for the use of the tool; all users are solely responsible for any decisions made based on the tool. The intended users of this tool should be well acquainted with local field conditions, and the information provided. It is recommended that you go through this document before general use. The tool shall be regarded as working material, which provides information for discussion that exemplifies how various types of data related to nutrient loss from arable land can be presented to users (e.g. farmers, advisors and authorities) at the field scale, or even within-field scale. All numbers of costs and payments mentioned are only examples in the system, and should be used only for testing the system. Please read information material before using the tool. Remember that changes of the tool can be made at any time since it is a developing product within the Waterdrive project.**

About the WaterGuide Tool

### Wetlands

This result tab contains modelled values for potential locations of wetland in the selected field. The map shows the results from the modelling based on the data used and assumptions made. This depends on the modelled values per sub-catchment are used. Only wetlands within a calculated optimal size range of 0.1-5.0 ha are displayed.

Verwenden Sie die Dokumentation für erläuternder Text und Verweise

- Wetland area (ha): Calculated optimal wetland size, based on a hydrological load where 100 m (100 m<sup>3</sup> water/m<sup>2</sup> wetland and year) is assumed to optimal. For run-off modelled values per sub-catchment are used. Only wetlands within a calculated optimal size range of 0.1-5.0 ha are displayed.
- P-reduction (kg/ha/year): Potential reduction in kg P/year in kg/ha wetland. Calculated according to Weisner et al. (2016).
- N-reduction (kg/ha/year): As above but for nitrogen (N).
- Load P (kg/year): Load in kg P/year for the potential wetlands. Calculations are based on the average runoff and HELCOM Pollution Load Compilation 7 (PLC-7) type concentrations in the subcatchment (Hansson et al., 2019).
- Load N (kg/year): As above but for N.
- Cost (SEK/kg P/year): Potential cost in SEK/kg P/year for the wetland locations. Calculations are based on the following assumptions: a construction cost of 350,000 SEK/ha wetland and 20 years (17,500 SEK/year); maintenance cost 4,000 SEK/year; tenant costs depending on region (2,334 SEK/year where Roxen is location and 1,486 SEK/year where Örsundaån is located; from Statistics Sweden (SCB) in 2018).
- Cost (SEK/kg N/year): As above but for N.
- Upstream (ha): Calculated upstream drainage area in ha to a wetland location.

Please note: In reality, other locations for wetland may be more suitable due to local conditions not included in the modelling. The map shows the results from the modelling based on the data used and assumptions made.

Regionale Daten

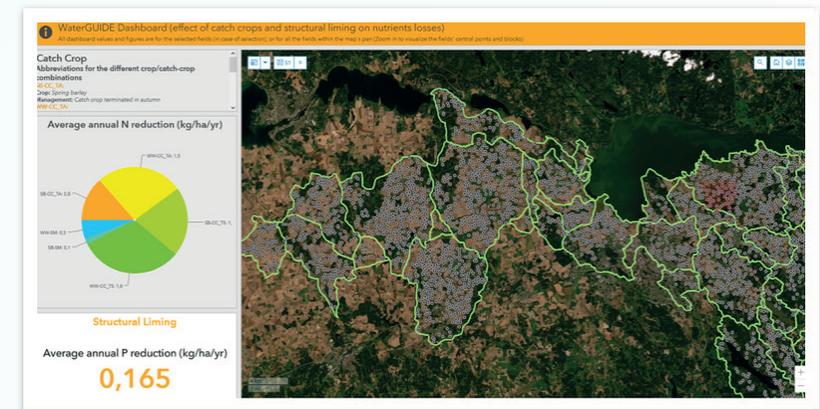

Herunterskalieren

Lokale Daten

Lokale Daten für regionale  
Überblick  
in einem Dashboard

<https://waterguide.online/nutrient-loss>

[https://bit.ly/waterguide\\_dashboard](https://bit.ly/waterguide_dashboard)

**Roxen-Bereich:**  
3379 Felder >2 ha Ackerland

**Örsundaån-Gebiet:**  
2418 Felder >2 ha Ackerland

**Beispiel: Wirkung von**

- Zwischenfrüchte bei reduziertem N-Verlust
- Strukturelles Kalken bei reduziertem P-Verlust

# Abschließende Bemerkungen

- Sehen Sie dies als Prototyp – nicht vollständig, erster Versuch
- Herausforderung zum Herunterskalieren – sowohl für Forscher als auch für Benutzer
- Enormer Datenbedarf – lokale Daten sollten zur Modellierung passen, viele Daten fehlen
- Leicht zu missinterpretieren – Tests und Training erforderlich
- Geeignet für Gruppendiskussionen – ein Teil der Entscheidungsunterstützung, nicht der einzige
- Neue Möglichkeiten – Wenn Sie anfangen, werden neue Möglichkeiten/Bedürfnisse offensichtlich
